

CONTROLLER INSTRUCTIONS

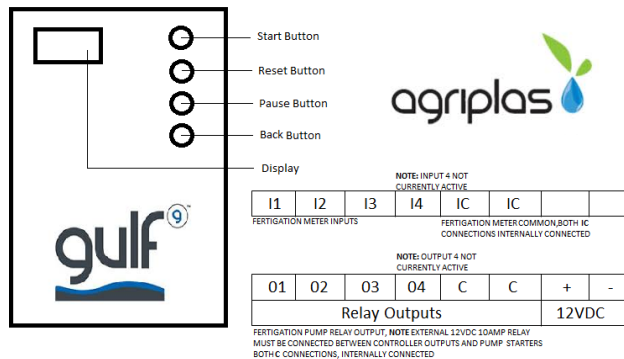

INTRODUCTION

The AGRIPLAS BATCH CONTROLLER has been designed to operate up to three independent fertigation pumps according to a customer's desired pre-set volume. The unit incorporates the input of each fertigation pump's designated fertigation meter, to dose to pre-set values.

The pumps can be run sequentially or all at the same time. A log is also kept of the total volume dosed by each pump since the last logging reset by the customer.

INSTALLATION

Securely mount the unit to the wall or cabinet using the 4 casing mountings. Mount this unit at least 2 meters away from any high power lines or pump control boxes.

This unit only uses dry contact inputs.

An external 12Vdc relay must be used per fertigation pump to activate the relevant pump.

The unit needs to be powered from a 12Vdc supply. Only a 12Vdc supply should be used otherwise the unit will be damaged.

PROGRAMMING
